DETAILED ACTION

1. This Office Action is the answer to the Amendment filed on December 21, 2006, which paper has been placed of record in the file.
2. Claims 1, 3-9, 11-57, 59, 61, 63, 65, and 67-99 are pending in this application.

Allowable Subject Matter/Reasons for Allowance

3. Claims **1, 9, 17, 22, 33, 34, 35, 36, 37, 38, 51, 53, 55, and 57** are allowed over the prior arts cited records.

The closets prior arts are:

1) Talati (US 5,903,878) discloses a method for providing validated electronic commerce transactions. A transaction order generated by a purchaser has a unique transaction identifier associated therewith and the purchase order is transmitted to a merchant and then to a transaction administrator. The transaction administrator contacts the original purchaser and provides the generated unique transaction identifier to confirm whether or not the transaction order was initially provided by the purchaser. Upon verification of origination of the transaction order by the purchaser and other transaction information, the transaction administrator notifies the merchant and the transaction may be completed.

2) Blonder (US 5,708,422) discloses an automated method for alerting a customer that a transaction is being initiated and for authorizing the transaction based on a confirmation/approval by the customer thereto. In accordance with one illustrative embodiment, a request to authorize the transaction is received, wherein the request

Art Unit: 3692

includes a customer identifier; a determination is made whether to authorize the transaction based on the customer identifier; if the determination is to authorize the transaction, that fact is communicated to the customer; a confirmation that the transaction should, in fact, be authorized is received back from the customer; and the transaction is authorized in response to the customer's confirmation thereof.

3) Sixtus (US 5,903,721) discloses a method for executing a secure online transaction request comprising user registration number, the vendor computer sending a transaction verification request comprising the user registration number and data indicative of the requested transaction to a trust server computer interconnected to the computer network. When the trust server receive transaction request from a vendor, it takes the user registration number and fetches from the database the user's identification information, including the credit card number that will be used in the transaction. Thus, after the initial secure communications with the trust server, the user need not transmit his credit card number over the Internet. There is no teaching in Sixtus transmitting account number and authorization number associated with account number to the trust server.

Therefore, it is clear from the description of Talati's, Blonder's and Sixtus's inventions that the prior arts do not considered the possibility of: initiating a verification connection between the consumer location and the third party contractor location, the verification connection including a verification web browser window provided from the on-line merchant location to the consumer location to initiate the verification connection between the consumer location and the third party contractor location, the verification

Art Unit: 3692

connection being independent of, and bypassing, the on-line merchant location, as included in claims 1, 9, 17, 22, 33, 34, 35, 36, 37, 38, 51, 53, 55, and 57.

4. Claims (3-8, 27, 28, 41, 73, 87), (11-16, 29, 42, 74, 88), (18-21, 30, 31, 43, 75, 89), (23-26, 32, 44, 76, 90), (39, 45, 67-72, 77), (40, 46, 78, 91), (47, 79, 92), (48, 80, 93), (49, 81, 94), (50, 82, 95), (52, 59, 83, 96), (54, 61, 84, 97), (56, 63, 85, 98) and (65, 86, 99), are allowed because they are dependent claims of the allowable independents 1, 9, 17, 22, 33, 34, 35, 36, 37, 38, 51, 53, 55, and 57 above, in that order.

Conclusion

5. Claims 1, 3-9, 11-57, 59, 61, 63, 65, and 67-99 are allowed.
